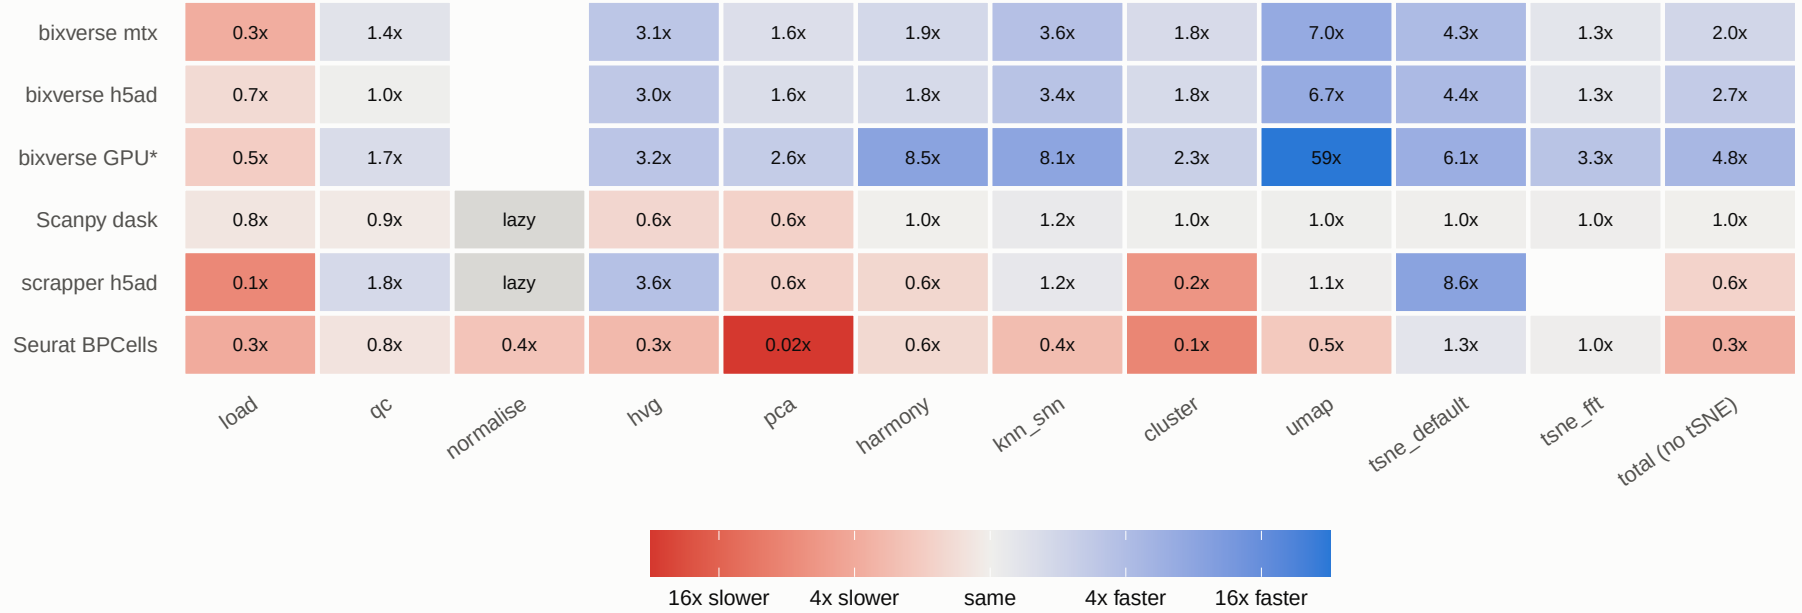
Speed−up per step against in−memory Scanpy (h5ad), 500k

The largest size in−memory Scanpy survives. Only runs that completed at 500k.



bixverse normalises during load. scrapper's default tSNE runs at theta = 1 and 500 iterations (the others 0.5 and 1000); matched, it takes 202 s at 500k.
